AB The polymer-immobilized photosensitizers comprise a cross-linked polymer backbone, a plurality of cationic ammonium or phosphonium groups covalently bound to the polymer backbone and an immobilized photosensitizer. The average total number of carbon atoms in the ammonium or phosphonium group is at least four and preferably at least 12. The photosensitizer can be either covalently or ionically bound to the polymer. Polymer-supported photosensitizers of the invention are unexpectedly superior in catalyzing the photosensitized oxidation of compds. containing carbon-carbon double bonds.

● 2 Na

GI

AB The title compds. have the structure I, where R1 is a C1-12 alkyl, R2 is an aryl, biaryl, heteroaryl, etc., R3-4 are (CH₂)_nSiR₅R₆R₇, resp., R5-7 are C1-12 alkyls, n = 0-5, X is a removable group decomposing to form illuminating compds. E.g., 3,3-bis[2-(trimethylsilyl)ethyl]-4-methoxy-4-[3-(phosphoryloxy)phenyl]-1,2-dioxetane di-Na salt (I) was prepared via the condensation of Me 3-[(tert-butyldimethylsilyl)oxy]benzoate with 2,2,8,8-Tetramethyl-2,8-disila-5-nonanone to give (Me₃SiCH₂CH₂)₂C:C(OMe)(C₆H₄(OSiMe₂Bu-t)-m) (II). II was then deprotected to give (Me₃SiCH₂CH₂)₂C:C(OMe)(C₆H₄OH-m) which was subsequently phosphorylated to give (Me₃SiCH₂CH₂)₂C:C(OMe)(C₆H₄(OPO₃Na₂)-m) (III). III was then converted in presence Rose Bengal to the final product I.

I

II

AB A dioxetane bearing a 1-siloxyfluoren-3-yl moiety I (R = H) and its 9,9-dimethylfluorenyl-analog I (R = Me) were synthesized. Treatment of the fluorenyl-substituted dioxetanes I with tetrabutylammonium fluoride afforded light with a maximum wavelength (λ_{\max}) shorter than that for the corresponding biphenyl-substituted dioxetane II. The chemiluminescent efficiencies (Φ_{CIEEL}) were slightly different from each other for I and II, though the CIEEL-decay rates were more rapid for I than for II.

AB Phenolic spiroadamantyl-substituted dioxetanes are well known base-induced chemiluminescent compds. Fast-atom bombardment collision-induced dissociation tandem mass spectrometry (FAB CID-MS/MS) of five phenolic spiroadamantyl-substituted dioxetanes in the neg.-ion mode clearly showed that a highly efficient cleavage of the dioxetane rings took place to produce the corresponding phenolate ion almost exclusively. The mass spectrometric behavior of these compds. reflects the highly efficient intramol. electron-transfer-induced cleavage of dioxetane rings, which participates in the highly efficient base-triggered chemiluminescent reactions of these compds. in solution

(dioxetane; relation between the structure of β -peroxyalkyl radicals and selectivity of epoxide formation in oxidation of substituted styrenes)
RN 364329-42-0 CAPLUS
CN 1,2-Dioxetane, 3-methoxy-3-(4-methoxyphenyl)- (9CI) (CA INDEX NAME)

AB Weak correlation between electronic and mol. structure parameters of ring- and chain-substituted styrenes and the β -peroxyalkyl radicals formed from them by addition of $\text{MeOO}\cdot$ to the β -position (e.g., in the simplest case $\text{PhCH}\cdot\text{CH}_2\text{OOMe}$) suggested that reactant properties alone were inadequate for explanation of epoxidn. selectivity, the latter determined by reaction of the β -peroxyalkyl radicals. A final regression equation for epoxidn. selectivity containing electron d., Coulomb repulsion, as well as thermodyn. terms for chain propagation (enthalpy of decomposition of β -peroxyalkyl radical to the epoxide + alkoxy radical, enthalpy of reaction of β -peroxyalkyl radical with O_2) had a correlation coefficient of 0.951.

AB A safe and high-performance method is provided for detecting and measuring anti-GAD (glutamic acid decarboxylase) autoantibody with a high sensitivity and a high specificity comparable to those achieved by RIA. A kit used for this method is also claimed. In this method, a sample is brought into contact with a support carrying an immobilized recombinant GAD antigen. Then, the antibody contained in the sample is bound to the antigen on the support to form an antigen-antibody complex. The complex is detected with the use of a chemiluminescent dioxetane derivative (e.g, 2-chloro-5-(4-methoxyspiro{1,2-dioxetane-3,2'-(5'-chloro)-tricyclo[3.3.1.1^{3,7}]decane}-4-yl)-1-phenylphosphoric acid disodium, 3-(4-methoxyspiro{1,2-dioxetane-3,2'-tricyclo[3.3.1.1^{3,7}]decane}-4-yl)-1-phenylphosphoric acid disodium) possessing a group (e.g, phosphate group) which can be cleaved with an enzyme (e.g, alkaline phosphatase) to generate chemiluminescence, and a secondary antibody (antibody capable of binding with human anti-GAD antibody or antibody capable of binding with recombinant GAD antigen) labeled with the enzyme capable of cleaving this group to generate chemiluminescence. This immunoassay method exhibited an excellence in basic properties such as dilution linearity, same-time reproducibility, day-to-day reproducibility, and influence by co-existing substances. Upon measuring anti-GAD antibody with serum samples from IDDM patients, a high correlation was observed between this method and the conventional radio-immunopptn. method.

AB Low-temperature singlet oxygenation of 1-ethoxy-2,2-diisopropylethylenes substituted with a benzo[b]furanyl or a benzo[b]thiophenyl group bearing a t-butyldimethylsiloxo group at the 5-, 6-, or 7-position of the aromatic ring I (R = 5-, 6-, or 7-t-BuMe₂SiO; X = O, S) afforded the corresponding

1,2-dioxetanes II in moderate to high yields. On treatment with tetrabutylammonium fluoride in DMSO, dioxetanes with a trigger (siloxy group) at the 5- or 7-position of the aromatic ring decomposed with emission of red light ($\lambda_{\text{max}} = 615\text{--}628\text{ nm}$), irrespectively of the aromatic ring being benzofuran or benzothiophene. For both series of benzofuran and benzothiophene analogs, an "odd/even" relationship between the position of an oxygen on the aromatic ring relative to the attachment point to the dioxetane and the chemiluminescent properties, maximum wavelength (λ_{max}), efficiency (Φ_{CL}), and half-life ($t_{1/2}$), is observed, as in the case for dioxetanes bearing a phenolic or naphtholic substituent.

AB Low-temperature singlet oxygenation of 1-alkoxy-1-aryl-2,2-diisopropylethylenes gives 1,2-dioxetanes with high selectivity. The dioxetanes are thermally stable enough to permit handling at room temperature, though the alkoxy group significantly affects their thermal stability and the order of half-life is $\text{tert-BuO} < \text{MeO} < \text{EtO} < \text{i-PrO}$. On treatment with tetrabutylammonium fluoride in DMSO, dioxetanes bearing a *m*-siloxyphenyl group decompose rapidly to emit intense blue light with $\Phi_{\text{CL}} > 0.2$. For the base-induced decomposition of these dioxetanes the order of rate of decomposition is

$\text{MeO} < \text{EtO} < \text{i-PrO} < \text{tert-BuO}$.

AB Six isomeric 3,3-diisopropyl-4-methoxy-4-[(silyl)-2-naphthalenyl]dioxetanes I (R = TBDMSO) were prepared and their fluoride-induced chemiluminescence was examined in DMSO. One dioxetane was found to be a new type of chemiluminescent substrate which gave an intense flash light. Other isomeric naphthalenyldioxetanes exhibited chemiluminescent properties in agreement with the 'odd/even' relationship.

AB The character of an allylic nitrogen affects significantly the reaction pathways as well as the chemoselectivity in the singlet oxygenation of allylic amines [(I; R=neopentyl, p-anisylmethyl, H), II, III (R=Me, Ph, CH₂CH₂CO₂Me) and IV]. Secondary amines (I; R=neopentyl, p-anisylmethyl) undergo α-oxidation to give imines. A primary amine (I; R=H) and amides III undergo preferentially the 1,2-addition of singlet oxygen, whereas the

singlet oxygenation of an imide (II) afforded selectively an ene reaction product. For a lactam (IV), the 1,2-addition and the ene reaction of singlet oxygen occur concurrently.

GI

AB Treatment of 3-alkoxymethyl-3-tert-butyl-4-(3-tert-butyldimethylsiloxy)phenyl-4-methoxy-1,2-dioxetanes I (R = Et, Pr, neopentyl) with TBAF in DMAO gives intensive blue light emission ($\lambda_{\max} = 463 \text{ nm}$, $\Phi_{\text{CL}} > 0.1$) with short half-life ($t_{1/2} < 1 \text{ s}$), whereas the methylene analogs cause chemiluminescence with far longer half-lives. A dioxetane II bearing a phosphoryloxyphenyl is cleaved enzymically by alkaline phosphatase to generate light with high intensity.

AB A chemiluminescent assay method and compns. are described which use a dialkyl-substituted dioxetane which is deprotected to trigger a chemiluminescent reaction. Chemiluminescent 1,2-dioxetane compds. substituted on the dioxetane ring with 2 nonspirofused alkyl groups which can be triggered by a reagent to generate light are disclosed. Dialkyl-substituted dioxetanes are useful for the detection of triggering agents including enzymes. The enzyme may be present alone or linked to a member of a specific binding pair in an immunoassay, DNA probe assay, or other assay where the enzyme is bound to a reporter mol.

GI

I

II

III

AB Olefins bearing an allylic oxygen I undergo 1,2-addition of singlet oxygen to afford exclusively the corresponding 1,2-dioxetanes II, whereas their methylene analogs III suffer competitively 1,2-addition and ene reaction. The reactivity of I preferring 1,2-addition is likely attributed to the steering effect by an allylic oxygen.

AB The singlet oxygenation of alkenes 3-R1OC6H4C(OR):C(CHMe2)2 [R = Me, Et, CHMe2, CMe3; R1 = Me, SiMe2CMe3] gives the corresponding dioxetanes, whose thermal stability and half-life of chemiluminescence induced by TBAF are significantly affected by the 3-alkoxyl group.

AB This chemiluminescent reagent, especially useful for determining a specific substance

in a biochem. sample, contains an aromatic primary amine compound I (X = residue containing activated methylene or methine; Y = O, S, aromatic; R = alkyl). The device, for determining H₂O₂, comprises ≥1 layer containing I.

AB Individual cells and subcellular particulates may be analyzed, or detected and separated, without the need for an external energy source by reacting endogenous or added components of cells and other particulate matter with added thermally, chemical, electrochem., photochem. or enzymically decomposable chemiluminescent compds. to produce optically detectable light energy emissions. White blood cells were fixed with formalin and then incubated sequentially with solution 1 (Na₂CO₃ buffer, pH 9.5 containing MgCl₂); solution 2 (solution 1 + 3-(2'-adamantyl)-4-methoxy-4-(3''-phosphoryloxy)phenyl-1,2-dioxetane [AMPPD]); solution 2 + Na fluorescein; and solution 2 + BDMQ chemiluminescence enhancer and Na fluorescein. Aliquots of the cell suspension were then placed on a glass fiber membrane and the membrane were sandwiched between 2 pieces of Mylar film into a camera luminometer. The light resulting from 1-min exposures was imaged on Polaroid Type 612 film. Images of single neutrophils and colonies of cells are shown. The neutrophils are rich in alkaline phosphatase that catalyzes decomposition of AMPPD. Figures show schematic representations of flow cytometers and images produced.
